Alga Azul Waste Water Treatment Septic Tank Waste Water Shock Treatment Kit

- **Environmental Criteria:**

Alga Azul 100% Organic

Alga Boost Class 1 Bacillus based bacteria – Naturally Occurring, Non Pathogenic, Conforms to ECD1907/2006

- **Product: Alga Azul Septic Tank Waste Water Shock Treatment Kit**

Every septic tank requires a large, active community of bacteria in its 'treatment zone' in order to function properly. When this community does not exist, or has become too small, a shock treatment can help to establish, or re-establish, it and avoid complications, such as smells and blockages. There are two situations in which septic tanks might require shock treatment:

Smelly Tanks: When septic tanks begin to smell and attract flies, it's a sure sign that the bacteria community within the system is under pressure. Swift administration of a 'shock treatment' can nip the problem in the bud and return the tank to working order.

Empty Tanks: Septic tanks are at their most vulnerable when they are empty, that is, when they have just been installed or have recently been pumped out. In these cases, it can take up to six weeks for an appropriate bacteria community to develop, by which point it may already be struggling to deal with a backlog of undigested waste. Shock treatment can establish a working population in just two weeks, greatly reducing the risk of your tank getting off to a 'bad start' and developing problems in the future.

- **Description:** Our Shock Treatment Kit helps to establish, or re-establish, the massive bacteria community your tank needs in order to function properly. It does so by combining fresh bacteria spores (Alga Boost Tablets) with a special natural tonic (Alga Azul), which stimulates and supports the new microbes, giving them everything they need to multiply when they get in the tank

- **Features**

Shock treatment can establish a working population of Bacteria in a septic tank in just two weeks

- **Benefits**

Greatly reducing the risk of your tank getting off to a 'bad start' and developing problems in the future.

Eliminates smelly tanks

Reduces fly's

- **General Application Ratio:** Applied over the course of a week, the Shock Treatment Kit contains five litres of Alga Azul and twelve Alga Boost Tablets. On the first day, the owner dissolves six of the tablets in half the Alga Azul and flushes the mixture into the septic tank via a toilet. One week later, the whole process is repeated. **For industrial applications please see separate data sheet**

- **Sectors:** Domestic, Hospitality, Sports & Leisure
